

Triadic Runtime Specification — Amendment Log

TRS-0001 — Triadic Runtime Specification v1.0-draft Status: **Frozen** (Sections 1–9) Date: this draft

Amendment process

Every entry below must cite exactly one of three justifications. No entry may cite "this feels cleaner" as its reason.

1. **Formal contradiction** — two parts of the frozen specification make incompatible claims.
2. **Implementation counterexample** — a reference runtime, built in good faith to conform, cannot satisfy a Section 4 or Section 6 requirement without an addition or correction.
3. **Demonstrably incomplete definition** — a term or rule is used before it's defined, or defined ambiguously enough that two conforming implementations could reasonably diverge.

Each amendment entry follows this template:

TRS-NNNN

Status: Pending | Accepted | Rejected

Issue:

[one or two sentences – what broke, or what's missing]

Justification:

[contradiction | counterexample | incomplete definition – pick one, argue it]

Counterexample or proof:

[the actual case, mechanically stated]

Resolution:

[what changed – quote the old and new text if the change is textual]

Result:

New primitive? [yes/no]

New axiom? [yes/no]

Well-formedness rule? [yes/no]

Theorem revised? [yes/no]

Affected sections:

[list]

Amendments are appended below in order. Sections 1–9 of the specification document itself are never edited in place once an amendment is accepted — the specification is re-issued as a new version (v1.1, v1.2, ...) with a changelog entry pointing back to the TRS number that justified each change.

Log

(No amendments yet. TRS-0002 will be the first entry once implementation or further adversarial construction produces a genuine counterexample.)
